

Some notes on burritos

When we want to take the derivative of a composite function $f(g(x))$, we use the Chain Rule:

$$\frac{d}{dx} [f(g(x))] = f'(g(x)) \cdot g'(x)$$

Composite functions are like burritos: they are made of a tortilla wrapped around a filling. In the setup $f(g(x))$, I am saying that the filling is $g(x)$ and the tortilla is $f(\sim)$.
